EAE GROUP IN NUMBERS

Since 1973

EAE Group of Companies started its journey in the electrical sector in 1973 with the establishment of EAE Elektrik. Since its founding, EAE has grown rapidly, expanding its production and areas of operation by incorporating EAE Lighting in 1983, EAE Machinery in 1996, EAE Electrotechnics in 2004, and EAE Technology in 2009.

EAE carries out its production activities in accordance with ISO 9001 Quality Management, ISO 14001 Environmental Management, ISO 14064-1 Greenhouse Gas Management System, ISO 45001 Occupational Health and Safety Management, ISO 10002 Customer Satisfaction Management, ISO 50001 Energy Management System, and ISO 27001 Information Security Management System standards.

E-LINE CCR

Introduction

Traditionally, carrying high currents (transformer to switchboards, main distribution lines, power distribution for factories) was achieved using multiples of large cross-section cables in parallel.
In order to support these cables in the buildings, there were used a lot of cable trays, cable ladders, under-floor cable channels, etc.

Using "Cast Resin Busbars" in outdoor environments, gallery transitions, chemical plants, harbour applications, tunnels instead of cables that are applied as mandatory offers many advantages.

Safe and Easy Installation
Detachable IP 68 Ext.
Due to alignment piece on the joint point, block joint element and busbar tray are aligned. This makes installation easier and correct on the right axes.

Advantages of a Cast Resin System

- ▶ IEC 61439-6 standard approved
- ▶ Protection degree IP68
- ▶ Protects against corrosion
- ▶ Resist insects and rodents
- ▶ Suitable for tropical climates
- ▶ High mechanical strength
- ▶ Protects against chimney effects
- ▶ High short circuit withstand
- ▶ Resistant to fire propagation
- ▶ Electrical continuity during fire
- ▶ Suitable to connect with E-Line KX busbar systems
- ▶ Voltage layout advantage thanks to its compact structure

***Special components can be manufactured quickly.**

High IP Isolation
Aluminium body over the IP 68 "DURACOMP" composite material that is made by specially selected pure silicium minerals and epoxy resin and has high temperature and mechanical operation features protects E-LINE CCR busbar from external elements.

Effective Heat Dissipation
Heat accumulated in conductors are transferred into the environment through the aluminium body thanks to the additives with high heat transfer rate used in the system. (Figure 1)

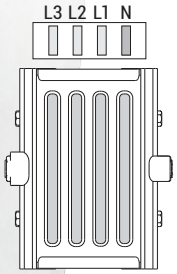

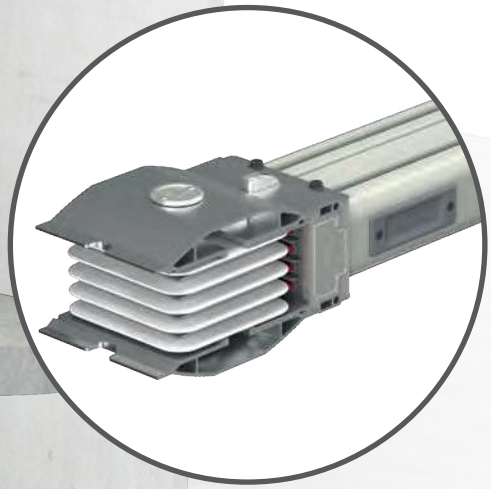

Figure 1

Short Circuit Withstand
High mechanical and thermal resistance within aluminium body thanks to DURACOMP material.

One Bolt Joint Ensures Safety and Easy Installation

E-Line CRR Busbars are installed by tightening the "one bolt joint". **Belleville spring washers** on both ends of the bolt retains the original contact pressure, ensuring a more secure, reliable and maintenance - free joint.

***The bolt is tightened to 83Nm (60 lbft)**

Fire and Earthquake Resistance
- 3 hours Electrical Continuity under Fire as per IEC 60331-1
- 2 hours current continuity according to BS 8602 standard
- Seismic Resistance as per IEC 60068-3-3 / 60068-2-57 and IEEE 693

EX - Protected
- ATEX as per EN 60079-0:2009, EN 60079-18:2009, EN60079-31:2009

II 2D IIIC Db

E-LINE CCR

Distribution & Horizontal Applications

When using the E-Line CCR to create an electrical distribution system, the following criteria should be taken into consideration.

- The Power of the load to be connected to the system and their locations.
- Utilisation factor (diversity) assay,
- Power and short circuit currents of transformers, System coordination with other distribution systems (heat, steam, water, etc.),
- Determining a route of the E-Line CCR on layout of the designed system,
- Determination of the types of supports according to plan,
- If necessary, the system can be integrated with E-Line KX busbar system.

Rated Current
The rating of the busbar current required is calculated using the formula shown below.

$$I_B = \frac{P.\alpha}{\sqrt{3}.U.\cos\varphi}$$

I_B = Operation current (A)
P = Total power load (W)
α = Utilisation factor (diversity)
U = Supply voltage (V)

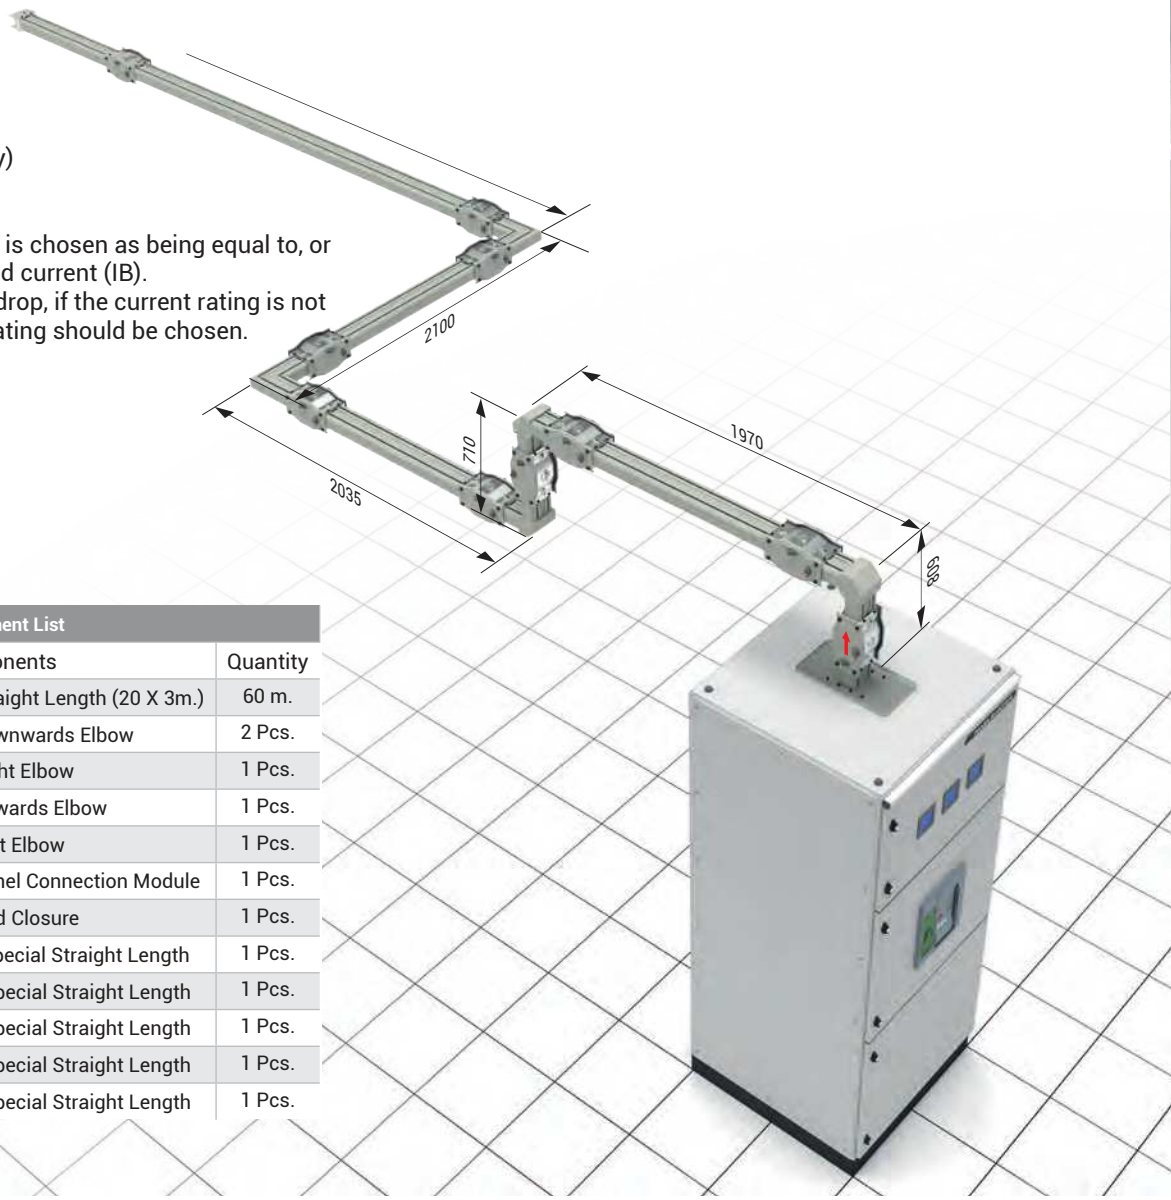

- The busbar current rating is chosen as being equal to, or greater than the calculated current (IB).
- After calculating the volt drop, if the current rating is not adequate, then a higher rating should be chosen.

Utilisation Factor (Diversity)
The utilisation factor (a) depends on the type and number of loads. Most are 0.7 or less. Intense Lighting and Motor Fed Lines “0,6” is quite difficult to rise above. Even at automobile welding plants it could fall down to “0,30”. With only one single and large load can it go up to “1”.

Voltage Drop
All the required values for voltage Drop Calculations, formulas, basic calculations for simple cases the tables are given on pages 6-9. Further support can be obtained from our Design Department.

Short Circuit Values
Short circuit test values are given on the tables on pages 6-9. The short circuit values high-light the high short circuit withstand characteristic of the E-Line CCR.

Busbar Installation Plan
Shown below is an example of an E-Line CCR busbar system. On request, our distributors' project and design departments will be pleased to help you in preparing your project.

Component List		
Item No	Components	Quantity
1	CCRC 20804 - STD Straight Length (20 X 3m.)	60 m.
2	CCRC 20804 - D Downwards Elbow	2 Pcs.
3	CCRC 20804 - R Right Elbow	1 Pcs.
4	CCRC 20804 - U Upwards Elbow	1 Pcs.
5	CCRC 20804 - L Left Elbow	1 Pcs.
6	CCRC 20804 - P10 Panel Connection Module	1 Pcs.
7	CCRC 20804 - S End Closure	1 Pcs.
8	CCRC 20804 - X95 Special Straight Length	1 Pcs.
9	CCRC 20804 - X120 Special Straight Length	1 Pcs.
10	CCRC 20804 - X122 Special Straight Length	1 Pcs.
11	CCRC 20804 - X200 Special Straight Length	1 Pcs.
12	CCRC 20804 - X174 Special Straight Length	1 Pcs.

E-LINE CCR

Riser & Vertical Applications

As each building's structure is different, each of the **E-Line CCR** projects has to be specially designed.

The details on this page briefly explain the information necessary for designing the vertical installation project.

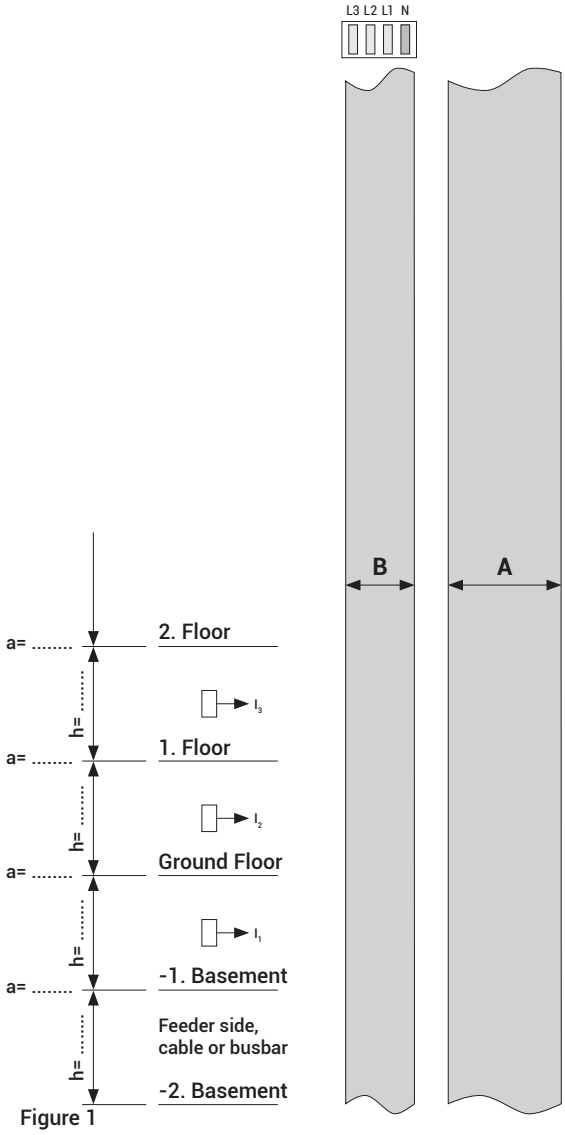

Figure 1

Pre-Project Design and cost Analysis

Before design and cost analysis can be made, please submit the following information to our Design Department.

Location and Dimensions of the floor penetration where the busbar line will be installed.
Floor height and Floor thickness (h=... a=...)
Vertical line feeding method (by busbar or by cable)

By supplying the above information of the dimensions on a drawing similar to the example in Figure 1 and by faxing or emailing it to us we will be able to produce a quotation.

Please refer to table on page 11 for "A" size.

Number of Conductors	B (mm)
3 Conductors	73
4 Conductors	80
4 ½ Conductors	87

Attention! The standard mounting of the Cast Resin busbar is with the conductors on edge.
This allows for the easy application of the resin at the joint.

Voltage Drop Calculation

Generally Voltage drop of a busbar system can be calculated with the following formula.

$$\Delta U = \sqrt{3}.L.I.(R_1.Cos\varphi + X_1.Sin\varphi)\ 10^{-3}\ [V]$$

ΔU	= Voltage Drop (V)
L	= Line Length (m)
I	= Line Current or Load (A)
R_1	= Resistance (mΩ/m)
X_1	= Reactance (mΩ/m)
Cosφ	= Power Factor

S = Supply Point

(1) All phase conductor characteristics have been determined according to Annex BB of IEC 61439-6.

(2) Fault-loop zero-sequences impedances have been determined according to Annex CC of IEC 61439-6.

(3) Fault-loop resistances and reactances have been determined according to Annex DD of IEC 61439-6.

*IK10 corresponds to impact energy of 50J according to IEC 62262.

** Cast Resin Busbars are produced with a minimum of 3 conductors.

Voltage Drop Calculation

Generally Voltage drop of a busbar system can be calculated with the following formula.

$$\Delta U = \sqrt{3}.L.I.(R_1.Cos\varphi + X_1.Sin\varphi)\ 10^{-3}\ [V]$$

ΔU	= Voltage Drop (V)
L	= Line Length (m)
I	= Line Current or Load (A)
R_1	= Resistance (mΩ/m)
X_1	= Reactance (mΩ/m)
Cosφ	= Power Factor

S = Supply Point

(1) All phase conductor characteristics have been determined according to Annex BB of IEC 61439-6.

(2) Fault-loop zero-sequences impedances have been determined according to Annex CC of IEC 61439-6.

(3) Fault-loop resistances and reactances have been determined according to Annex DD of IEC 61439-6.

*IK10 corresponds to impact energy of 50J according to IEC 62262.

** Cast Resin Busbars are produced with a minimum of 3 conductors.

Standard Modules

DDT, YDT

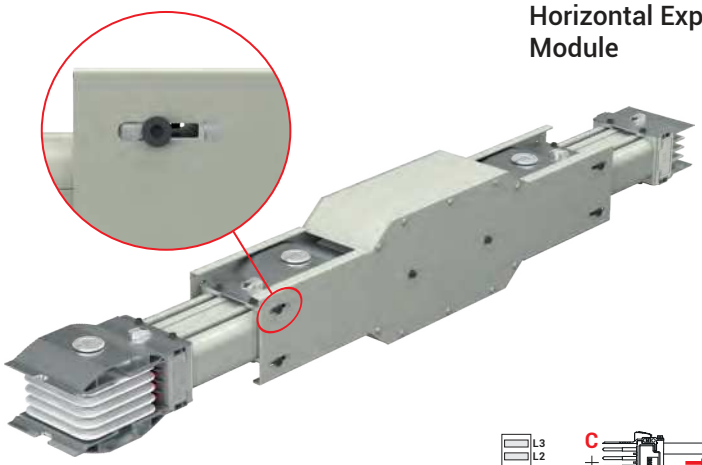

Vertical Expansion Module - DDT

Sample Order:
CCRC 32804 - B - DDT
3200 A, Copper, Bolt-on,
IP 68, 4 Conductor

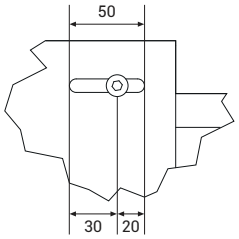

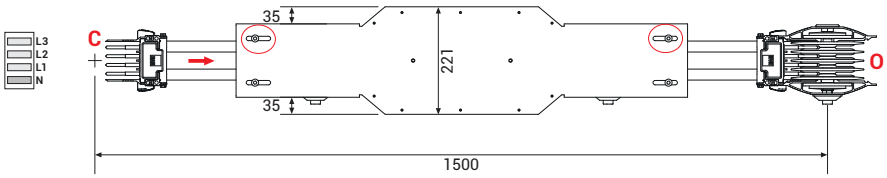

DDT Expansion

- Used for vertical applications in multi storey buildings. One vertical expansion unit is advised to be used at every floor between fixed support points.

Horizontal Expansion Module - YDT

YDT Horizontal Expansion Module

- It is used as a horizontal expansion element every 40m on a long straight run.

Note:

- If the busbar run passes through a horizontal expansion of building, a Dilation Module has to be used.
- Dilation Modules must be used for very long free lines (>75m) that are closed with an end closer and not fixed on the hanger.
- The movement span of Dilation Module is 50mm.

We recommend consulting our company during the project phase.

E-LINE CCR

Measuring a Special Length

After installation of standard busbar 3m lengths, you will be in need of special lengths which are smaller than 3m.The minimum length for these special elements can be 450mm. Please measure the lengths of these modules as shown below.

Length A is measured between housing of 2 busbars in mm. A. The special length is calculated by deducting 290mm from this measured length.

X = A - 290mm

X = Length of Special Busbar

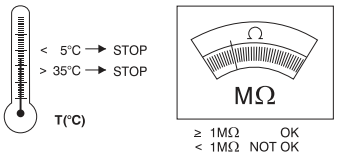

E-LINE CCR

Preparation of Joint Flex-Comp

The meger test must be carried out before casting. If Flex-Comp (A) and Flex-Comp (B) are stored in a cold environment, they should be kept in a warm environment one day before casting (> 20 °C). Ambient temperature during casting should be 5 °C < T casting < 35 °C.

Depending on weather conditions, the curing time may exceed 48 hours. After casting, the surrounding area of the block joint must be covered to prevent contact with liquids.

Preparation of Flex-Comp

Flex-Comp A

Flex-Comp B

Add Flex-Comp (B) product into Flex-Comp (A).
One set is 3.5 kg. The required kg values for filling the joints according to their cross-section are indicated in the table next to it. The number of sets to be prepared should be calculated based on the number of joints in the assembly time.

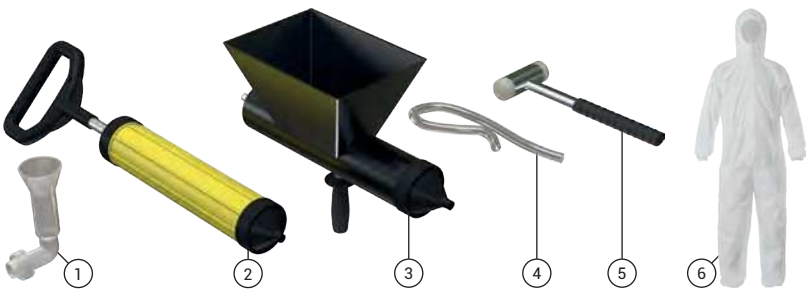

Mix the mixture counter clock wise with a beater at low speed for at least 30 seconds until it is homogeneous.

Amount of Resin to be Used

E-LINE CCR

Installation / Horizontal

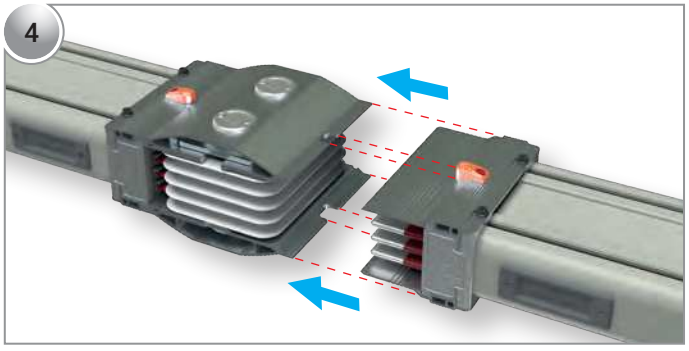

Remove the busbar protection covers by unscrewing the bolts

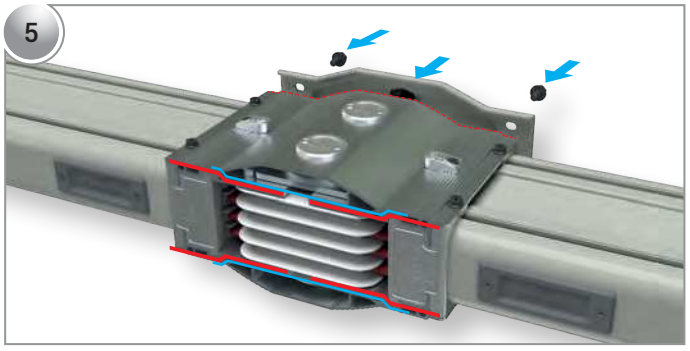

Remove the nut locking cover.

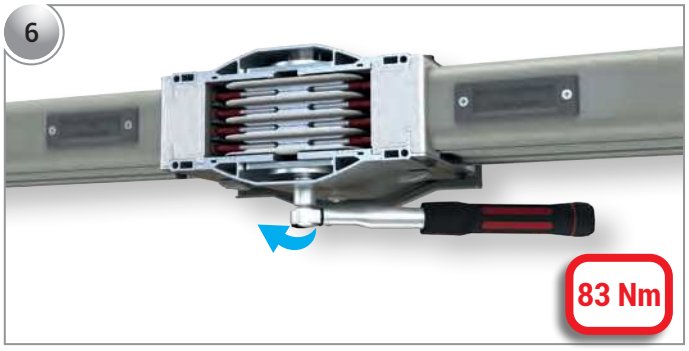

Loosen the block splice nuts.

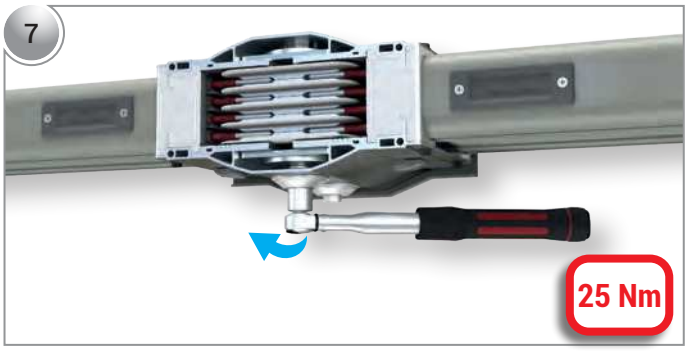

Verify the orientation and compatibility of the busbars and alignment components to be added. Connect the busbars with the small alignment components on top.

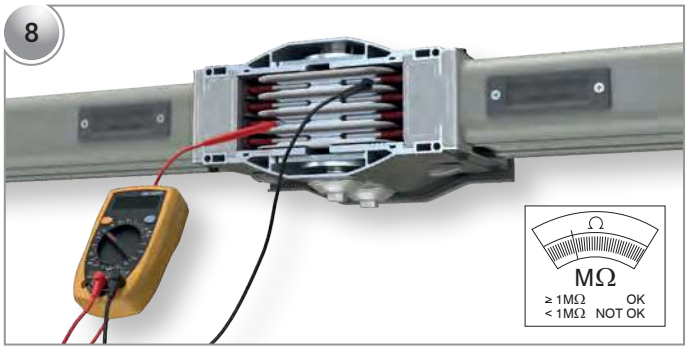

Install the block joint cover to align the busbars, tightening the cover bolts to a moderate torque. Adjust until the busbars fit perfectly into the alignment slots.

After verifying alignment, torque the block joint nuts to 83 Nm.

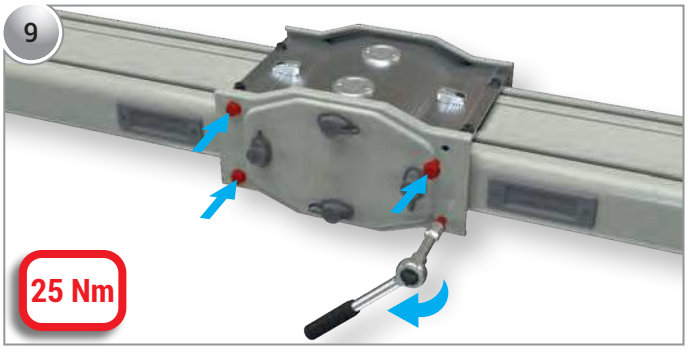

Reinstall the nut locking covers and torque with 25 Nm.

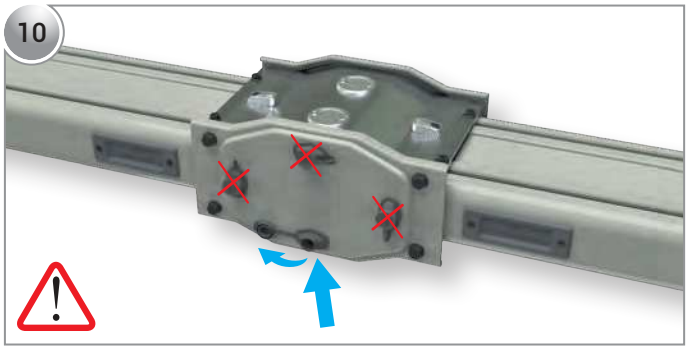

Perform an insulation resistance test between all phases at the installed block joint point.

E-LINE CCR

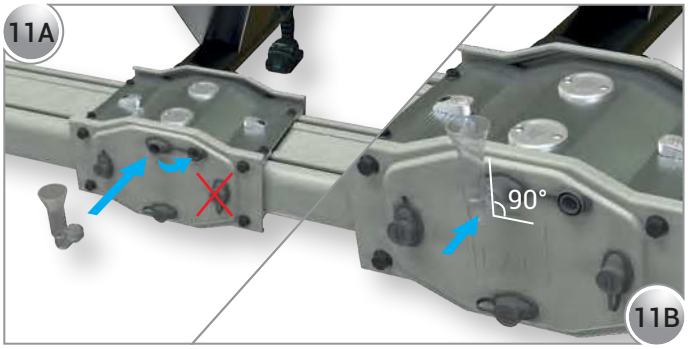

Installation / Horizontal

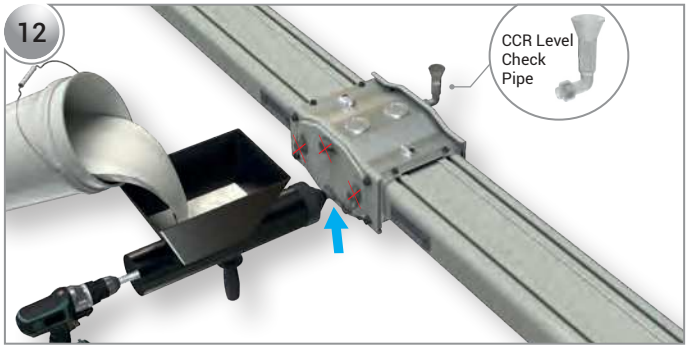

Install the other block joint cover and torque its bolts to 25 Nm.

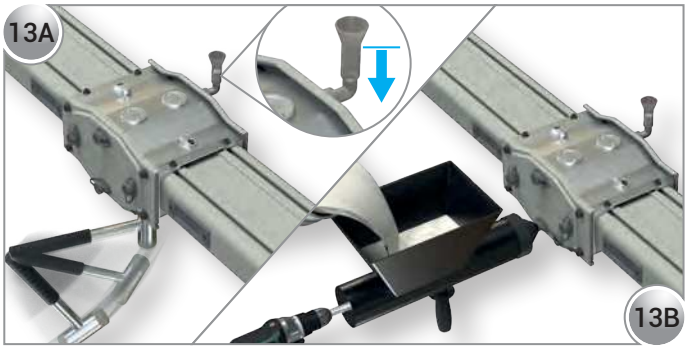

Remove the plastic cover from the casting area as shown in the visual.

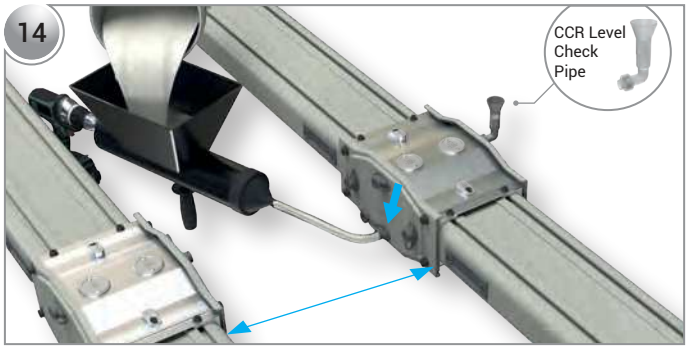

Open the plastic cover on the opposite side of the block joint to be cast, and install the CCR Block Joint Casting Level Control Plastic.
Attention: The level control plastic must be oriented 90° upwards.

Inject material through the filling hole as shown. Continue filling until Flex-Comp is visible inside the level control plastic.
Attention: Check the Flex-Comp level in the level control plastic. Add more Flex-Comp if it drops.

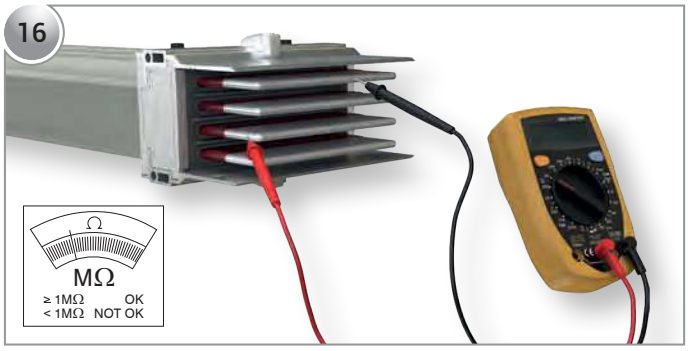

After the initial filling, tap the busbar block joint from underneath with a plastic mallet. If a drop in the Flex-Comp level is observed in the level control plastic, continue the filling process.
Attention: Refilling the process until the Flex-Comp level stabilizes.

Use a transparent hose in confined spaces to complete the filling process through the indicated filling hole. Continue filling until Flex-Comp is visible inside the control plastic, and apply step 13.

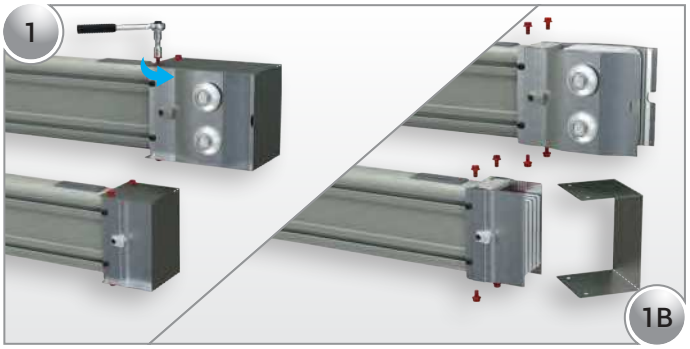

Once the injection process is complete, close the plastic cover and finalize the installation.

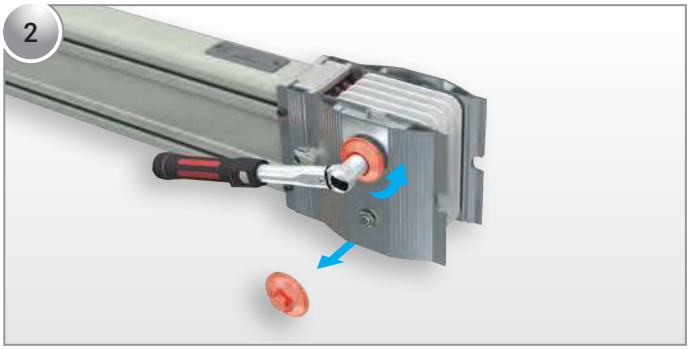

An insulation resistance test must be conducted at least 24 hours after the procedure is completed.

E-LINE CCR

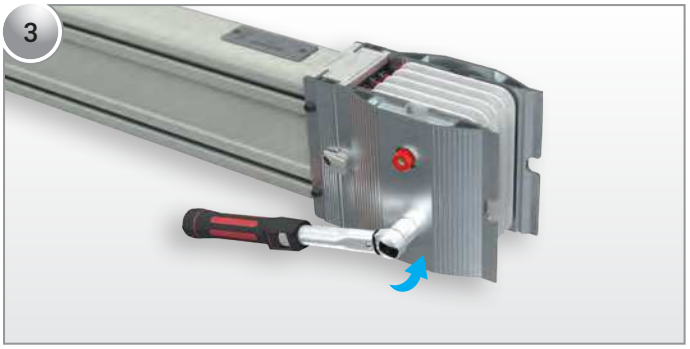

Installation / Edgewise

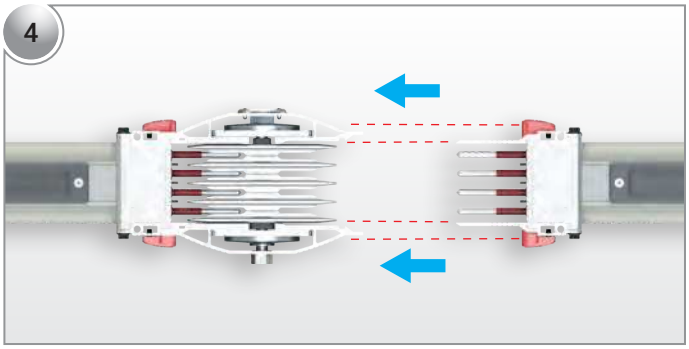

Remove the busbar protection covers by unscrewing the bolts.

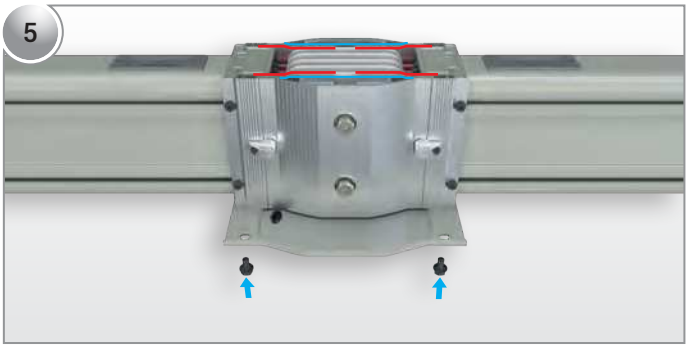

Remove the nut locking cover.

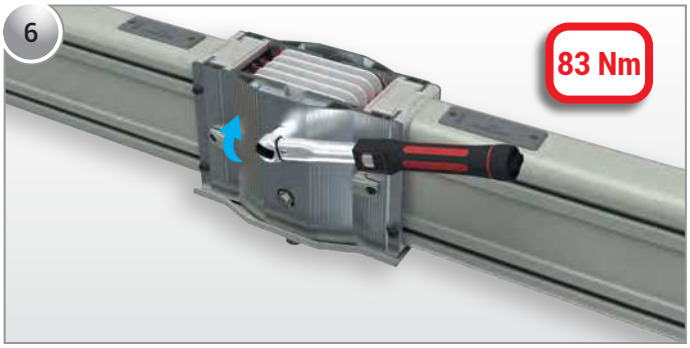

Loosen the block joint nuts.

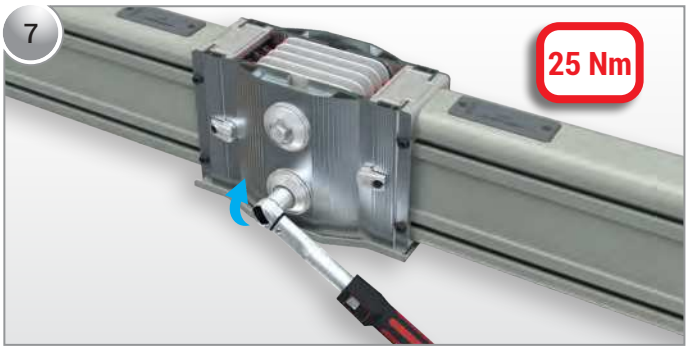

Verify the orientation and compatibility of the busbars and alignment components to be added. Connect the busbars with the small alignment components on top.

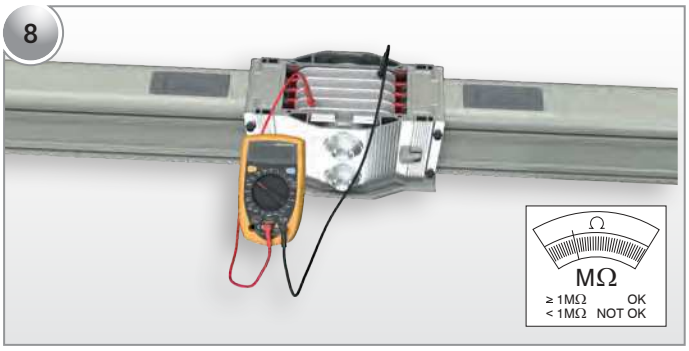

Install the lower block joint cover to align the busbars, tightening the cover bolts to a moderate torque. Adjust until the busbars fit perfectly into the alignment slots.

After verifying alignment, torque the block joint nuts to 83 Nm.

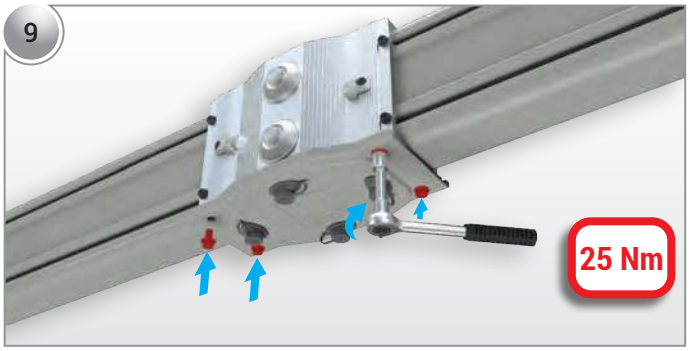

Reinstall the nut locking covers and torque with 25 Nm.

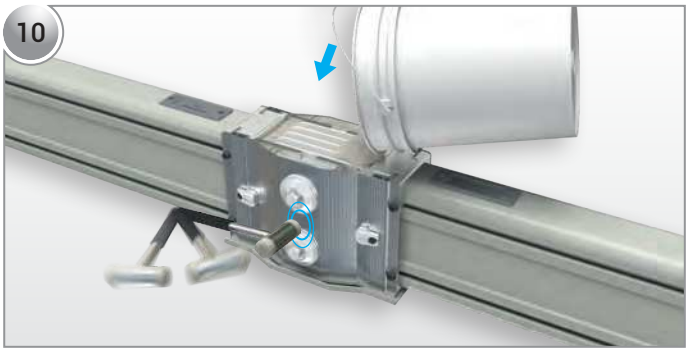

Perform an insulation resistance test between all phases at the installed block jiont point

9

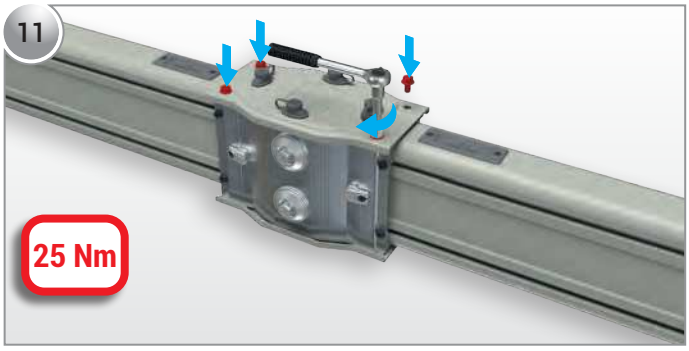

Torque the bolts of the lower block joint cover to 25 Nm.

10

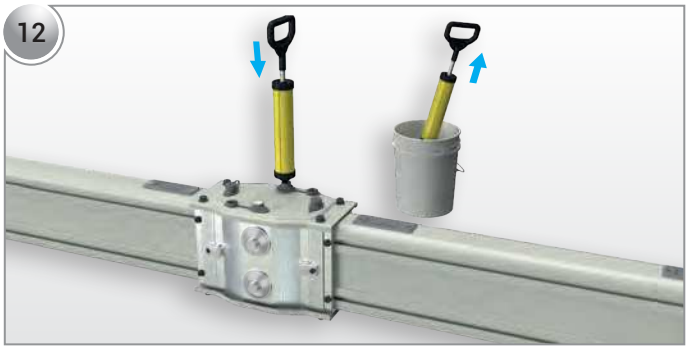

At the open end of the block joint cover, perform the Flex-Comp casting to the top level of the blocj joint. Apply vibration with a plastic mallet.

11

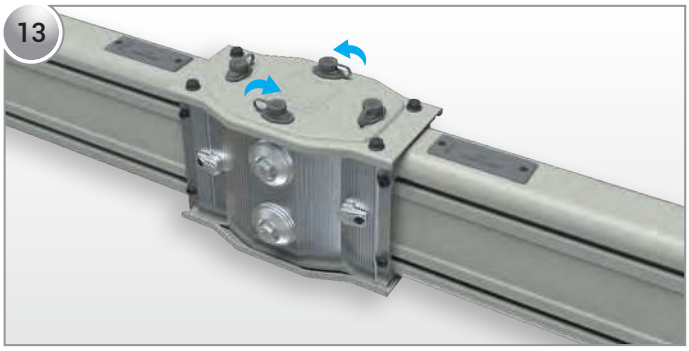

Install the top block joint cover and torque its bolts to 25 Nm.

12

Ensure the injection piston is fitted to prevent leakage at the casting opening and inject Flex-Comp material into the block joint cavity using a lever. Continue injection until Flex-Comp is visible from the other end. Close the plastic cover and finalize the installation.

13

Once the injection process is complete, close the plastic cover and finalize the installation.

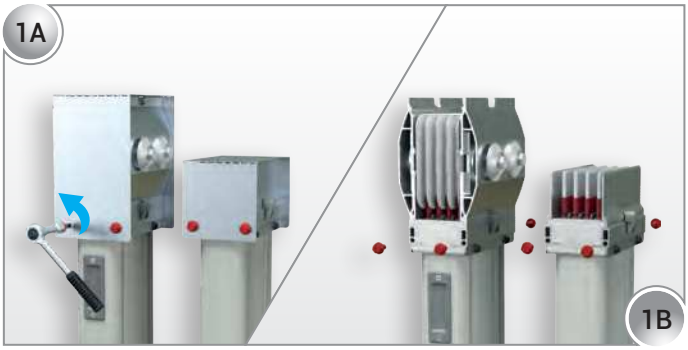

14

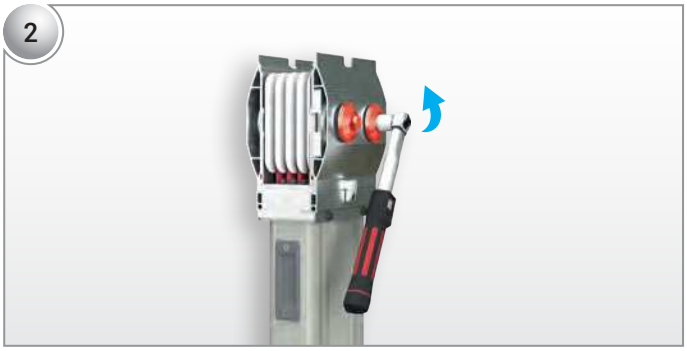

An insulation resistance test must be conducted at least 24 hours after the procedure is completed.

E-LINE CCR

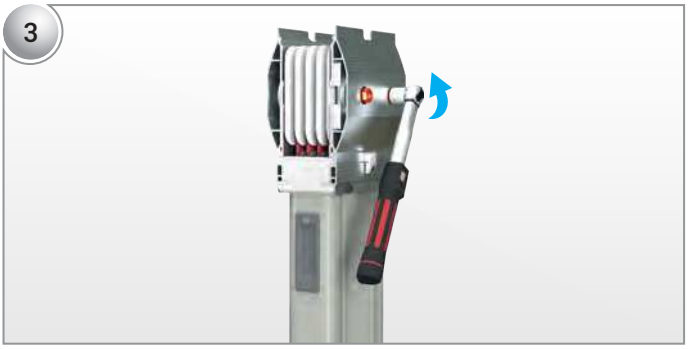

Installation / Vertical

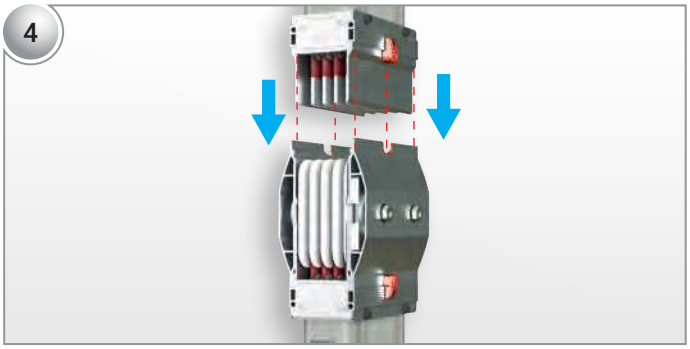

Remove the busbar protection covers by unscrewing the bolts

600A...6300A COMPACT BUSBAR PRODUCT OVERVIEW (E-LINE CCR)

1- Standards & Certification:

-Busbar trunking system shall be designed, type tested and, manufactured in accordance with the International standard IEC 61439-6. Type test shall be documented by independent and internationally accredited testing and certification bodies. Short circuit type tests shall be conducted by independent and accredited testing and certification bodies. The busbar system must have a certificate of compliance with standards.

2- General Structure Of The System

-The busbar system should be low impedance in accordance with the following characteristics. The tin coated conductors are arranged as a sandwich construction inside the resin body without any air gaps.

2.1- Electirical Characteristics

-Busbar systems nominal insulation voltage shall be 1000V

-As per ampere rates, minimum short circuit values shall be as given below;

For Aluminium Conductors;

600A	: 1 sec/rms	25kA, peak	52,5kA
800-1250A	: 1 sec/rms	35kA, peak	73,5kA
1600A	: 1 sec/rms	60kA, peak	132kA
2000A	: 1 sec/rms	80kA, peak	176kA
2500A and above	: 1 sec/rms	100kA, peak	220kA

For Copper Conductors;

650-850A	: 1 sec/rms	35kA, peak	73,5kA
1000A	: 1 sec/rms	50kA, peak	105kA
1250-1600-2000A	: 1 sec/rms	80kA, peak	176kA
2500-3200A	: 1 sec/rms	100kA, peak	220kA
3400A and above	: 1 sec/rms	120kA, peak	264kA

2.2- Housing

-The housing of the busbar system shall be manufactured with specially developed cast material.

-The structure of the busbar lengths shall have conductors tin plated along their complete length within the housing.

-Multi-path busbars should be combined in a single body so that they are not separated from each other.

-All aluminum surfaces in our product groups are plated with tin. When exposed to water and other corrosive liquids, Tin(II) Oxide and Tin(IV) Oxide (which typically appear as brown and white spots) may form. It is known that the formation of these oxides does not negatively affect the functional properties of the product.

-Up and down, right-left turn elements, "T" and offset elements, panel, transformer and cable connectors, termination, horizontal and vertical expansion elements should be standard in the Busbar trunking system. Special modules and different lengths busbar ducts that may be required during the application of the project must be manufactured in a short time in accordance with standard specifications and technology.

-If busbar runs pass through the building expansion joint a horizontal expansion element shall be used in the run. In addition horizontal expansion elements should be used every 40 m along a horizontal run.

2.3- Conductors and Phase Configuration

-Compact busbar system shall have aluminium conductors between 600A – 5400A.

-Compact busbar system shall have copper conductors between 650A – 6300A.

-Busbar system shall have the following number of conductors and wire configuration.

a) 3 Conductors
b) 4 Conductors
c) 4 ½ Conductors
d) 5 Conductors

-Neutral conductor shall have the same cross section as the phase conductor cross section.

-Aluminium conductors shall be of EC grade aluminium. Minimum conductivity shall be 34m/mm².Ω. All surfaces of aluminium conductors shall be tin plated.

-Copper conductors shall be minimum 99,95% electrolytic copper. Minimum conductivity shall be 56m/mm².Ω. all surfaces of electrolytic copper conductors shall be tin plated.

2.4- Insulation

-Busbars shall be insulated using a mixture of specially selected silica and calcite mixed with an electrical grade epoxy resin to make a superior composite material. This insulation material must have a high impact resistance against external impacts.

2.5- Modular Joint Construction

-The busbar lengths must be joined together with the joint's point drawer type modular block joint system by placing the conductors in the conductive socket in the block insert. Joint block insulators should be high strength CTP insulators. The joint block's centre bolt should be tightened with a torque wrench set to 83 Nm (60 lb ft) after installation.

2.6- Protection

-Protection degree of the housing and joints shall be IP68.

3- Installation and Commisioning

-The installation of the busbar system should be done in accordance with the type and current values shown in these plans in accordance with the electrical project, electrical single line schemes, layout plans and detailed busbar application projects, the manufacturer's installation instructions must be observed carefully during the assembly process. The central joint's bolts must be tightened with the appropriate torque wrench and the nut side of the bolt must be secured with the nut locking cap.

-After installation of the busbar system the installation should be checked for compliance with the manufacturer's instructions and the requirements of the project, an insulation test should be done. Insulation resistance between all conductors and body has to be bigger than 1 megaohm.

SUSTAINABLE FUTURE

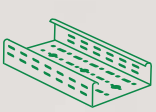

Sustainability Management at EAE Elektrik

As part of our goal to support sustainable development and green transformation, measuring, evaluating, and managing all economic, environmental, and social impacts resulting from our sustainability practices is a key governance priority for EAE Elektrik. We act with great care in analyzing, monitoring, and managing the economic, environmental, and social impacts and risks that arise throughout our value chain in both our national and global operations.
